

Bring useful AI to everyone — without sending anyone's life to the *cloud*.

Warden is a home and institutional AI that runs entirely **on local hardware**, built on free, open-source software. No datacenters. No subscriptions. No personal information leaving the building. It gives schools, seniors, patients, and people with disabilities the same access to capable AI as anyone else — at the cost of a computer, not a contract.

01 THE PROBLEM

Today's AI is gated twice: your data goes away, and the price to keep it keeps rising.

THE PRIVACY TOLL

Cloud AI only works by sending every question, document, and record to a private datacenter. For a frail elder's health notes, a student's file, or a disabled person's care plan, that transfer is a compliance problem before it's a

THE ACCESS TOLL

Useful AI lives behind per-seat subscriptions and datacenter budgets. The institutions that serve the people who need AI most — underfunded schools, care homes, hospitals, disability services — are the ones least

THE HARDWARE TOLL

Running AI locally is honest work: these machines still draw serious power, and the hardware itself is getting more expensive. Datacenter build-outs are buying up the world's memory supply, and the resulting RAM shortage has pushed the cost of a

technical one — and an ethical one before it's a compliance problem.

able to pay that toll. The gap widens by default.

capable machine up for everyone. That inflated cost of entry is precisely what this proposal exists to fight.

02 THE WARDEN APPROACH

Keep the data. Keep the model. Run it in the room.

Warden runs the AI model on the same machine it serves. The software is free and open-source; the only cost is the computer it runs on. Because nothing leaves the device, the populations who need the most protection get the most protection by default — not by policy, by architecture.

03 WHO IT SERVES

The people privacy law exists to protect get privacy by design.

SH

Schools & students

Student work, IEPs, and records never leave the building. Teachers get a capable AI assistant without exposing minors' data to a vendor.

FERPA / student-data safe by architecture

EL

Elders & care homes

Reminders, schedules, email help, and a patient voice — running on a single machine in the home or facility. No confusing accounts, no data leaving the residence.

HIPAA-sensitive by architecture

HO

Hospitals & clinics

Patient questions, discharge instructions, and clinical notes handled on a machine inside the facility. No record ever transits a vendor's servers.

HIPAA / clinical-data safe by architecture

DS

People with disabilities

A voice-driven assistant that holds the user's context locally and never ships their care details to a third party. Dignity and privacy in one decision.

Care-plan private by architecture

04 THE MODEL

Public funds the hardware.
The software is free.
Training sustains it.

01

Government funds installation for the needy

Public procurement buys and installs the local computers — on the order of \$100,000 machines with the memory and power to run capable AI — in schools, care homes, hospitals, and disability services. The state owns the hardware; the institution owns its data. Free AI for the people inside, permanently.

Public sector
FUNDS HARDWARE +
INSTALL

02 The software is given away free

Open source

\$0 LICENSE, FOREVER

Warden is free, open-source software. No license fees to the institution, no per-seat cost to the taxpayer beyond the one-time hardware. Any school or facility can run it, audit it, or extend it.

03 Education is sold to those who can pay

Private market

FUNDS THE MISSION

Private training on how to actually use AI tools — sold to districts, businesses, and individuals who can afford it — funds the work and the free deployment to those who can't.

05 THE ENDGAME

Once it's sustained, the whole thing goes *open*.

The education revenue exists to buy time — enough to mature the platform and put more into a more profitable ambition. At that point Warden's full design and source are released to the public for free. The state, the schools, and the public own the infrastructure they paid for, outright.

06 THE ASK

Install local AI
in the rooms that
need it most.

STEP 1

Pilot Warden in a small set of classrooms and one care facility. One capable machine per site. Measure use, privacy posture, power draw, and cost.

STEP 2

Procure \$100,000-class machines at scale for the institutions serving students, patients, elders, and disabled residents. Free software, no per-seat fees — the hardware is the whole cost.

STEP 3

Fund ongoing training so staff can use the tools well — the revenue stream that keeps the free deployment self-sustaining.
